BRAND GUIDELINES V1.0

# PANINI VISUAL LEXICON

Identity, Iconography, and Interface Standards

## The Primary Mark: The Algorithmic 'P'

### ANATOMY OF THE EMBLEM

The PANINI primary logo represents the intersection of human language and machine computation. It is not merely a lettermark; it is a structural diagram representing how the OS assistant operates.

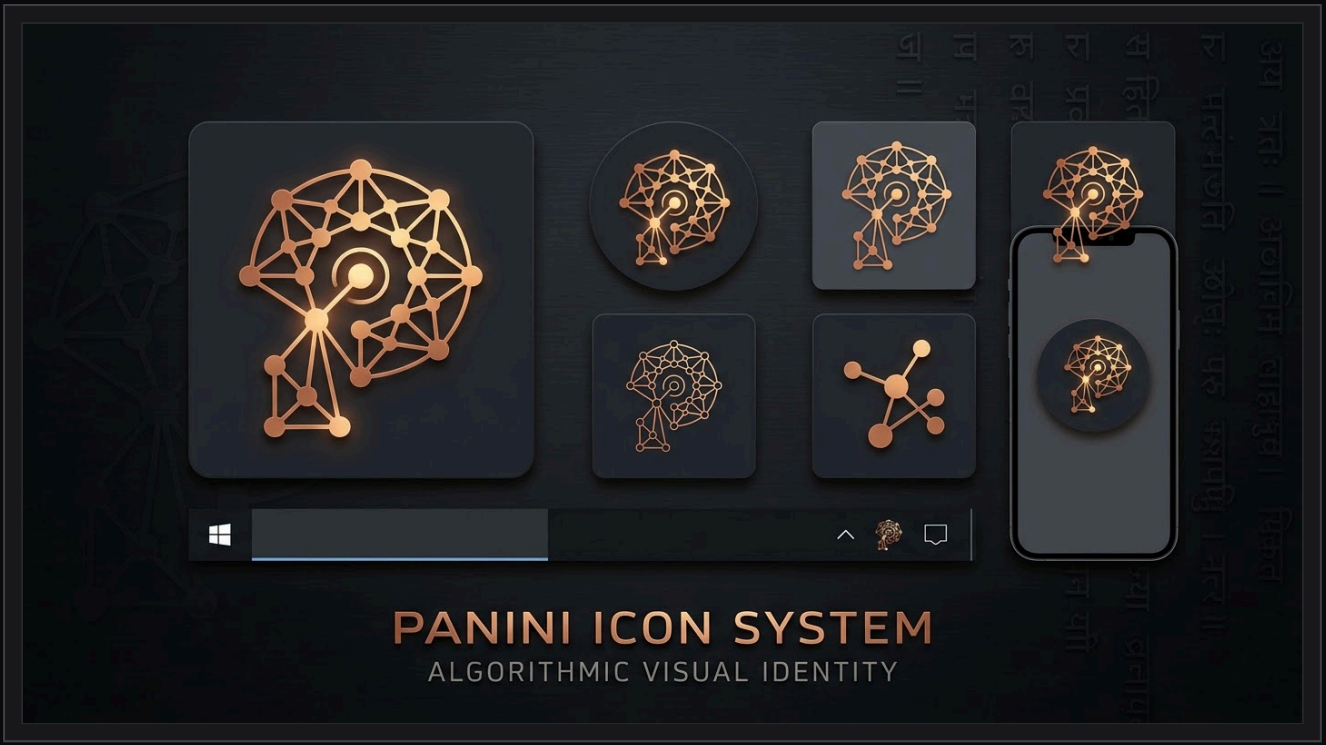

**The Root Node (Dhatu)**

The bright, glowing central point represents the user's initial prompt or voice command. It is the central authority from which all actions are derived.

**The Derivation Network (Sutras)**

The geometric web forming the shape of the 'P' visualizes Pāṇini's grammatical rules branching outwards, representing the delegation pathways to the Browser, Desktop, Code, and Search gateways.

# Iconography & Scale System

Because PANINI is a cross-layer assistant—existing as a desktop avatar, a system tray icon, a web console, and potentially a mobile companion—the logo is designed as a responsive identity system. It scales in complexity depending on the real estate available.

## ICONOGRAPHY VARIATIONS

| ENVIRONMENT | SCALE VARIANT | DESIGN EXECUTION |
|---|---|---|
| **Desktop Avatar (Electron)** | Full Complexity | The complete, animated node network. Breathing copper glow, with full structural geometry visible on screen. |
| **Web Console (:3200)** | App Icon (Rounded Square) | Placed on a subtle zinc (#18181B) surface to separate it from the deep background of the web dashboard. |
| **Mobile / Companion** | Circular / Badge | Optimized for touch interfaces. The outer bounding box is removed to allow the geometric 'P' to dominate the circular clipping mask. |
| **Windows System Tray** | Minimal Node Cluster | At 16x16px, the 'P' shape becomes illegible. The identity reduces to its absolute purest form: a 4-point node cluster (Root + 3 connecting threads) representing the active gateways. |

## Core Palette

The PANINI palette is strictly constrained to convey "Algorithmic Antiquity." We avoid pure whites, bright blues, and sterile grays. The interface should feel like precise mathematical instruments forged in dark metal.

**Obsidian Void**
#0A0A0C
Primary background. Used for the Electron desktop wrapper and the deepest layers of the web console.

**Structural Zinc**
#18181B
Surface layer. Used for data cards, terminal backgrounds, and distinct UI boundaries.

**System Copper**
#B87333
Primary brand accent. Used for the central identity, primary active nodes, and key algorithmic highlights.

**Listening Amber**
#FFBF00
Action state. Strictly reserved for voice-input states, hot microphones, and active execution pathways.

## Typography Standards

Typography separates the functional OS data from the narrative branding. System fonts are preferred to keep the Electron bundle lightweight and native to Windows, while a strict monospace is enforced for all runtime outputs.

| TYPEFACE FAMILY | ROLE IN SYSTEM | STYLING RULES |
|---|---|---|
| **Segoe UI** (Windows Native) | Primary Interface / Body | Weights: Light (300) for H1/H2, Regular (400) for prose. Used to blend seamlessly into the Windows 11 desktop environment. |
| **JetBrains Mono / Consolas** | Telemetry & Code | Strictly used for the Web Console (:3200), logging, execution blocks, and memory state telemetry. Never used for general prose. |
| **Noto Sans Devanagari** | Ornamental / Watermarks | Used at low opacity (< 20%) in backgrounds or as tiny subscripts (e.g., अन्वेषण next to "Search") to reinforce the ancient lore. |
